PROFESSIONAL SUMMARY

DevOps engineer with three years across both major clouds: two years of AWS infrastructure and CI/CD at Atya Technologies, now building highly available Azure architectures at Nexiotron. Strongest on the path from commit to production — pipelines, infrastructure as code, containerisation, and the monitoring needed to tell which layer actually broke. Track record of measurable results: 40% faster deployments, 25% lower monthly cloud spend, 60% less manual provisioning time.

TECHNICAL SKILLS

Cloud & Infrastructure: AWS (EC2, S3, IAM, RDS, VPC, CloudWatch, Elastic Beanstalk), Microsoft Azure, Docker, Kubernetes, Terraform

CI/CD & Automation: Jenkins, GitHub Actions, Azure Pipelines, AWS CodePipeline & CodeDeploy, Ansible

Version Control & Scripting: Git, Bash, Python

Operating Systems: Linux (Ubuntu, CentOS), Windows

Monitoring & Logging: Grafana, Prometheus, CloudWatch Logs, Sentry, Uptime Robot

Networking & Security: Nginx, Reverse proxying, Firewalls, SSL/TLS, IAM Policies

PROFESSIONAL EXPERIENCE

Nexiotron India Pvt Ltd | Hyderabad, India | Azure DevOps Engineer

Nov 2025 – Present

- Spearhead the design, implementation and maintenance of highly available cloud architectures on Azure, aligning infrastructure with application development lifecycles.
- Automate complex application deployments and infrastructure provisioning using Terraform and Azure Pipelines, significantly increasing deployment frequency.
- Collaborate with cross-functional development teams to containerise modern web applications (React, Django and Next.js stacks) using Docker, and manage their orchestration.

Atya Technologies Pvt. Ltd. | Hyderabad, India | AWS DevOps Engineer

Sep 2023 – Sep 2025

- Designed and executed automated CI/CD pipelines using Jenkins and GitHub Actions, reducing deployment times by 40%.
- Managed AWS infrastructure, optimising EC2 instance usage and implementing cost-saving measures that reduced monthly cloud expenditure by 25%.
- Automated infrastructure provisioning from scratch using Terraform, cutting manual setup time by 60%.
- Configured Nginx as a reverse proxy for secure application routing and load balancing, improving overall application performance by 30%.
- Deployed monitoring and alerting solutions using Prometheus and Grafana, substantially improving system observability and incident response.

KEY PROJECTS

DevOps SaaS Platform Infrastructure Setup (End-to-End)

Nov 2025 – Present

- **Overview:** Architected and deployed a scalable, multi-tenant DevOps Software-as-a-Service platform from scratch to automate client deployments.
- **Infrastructure & IaC:** Provisioned foundational AWS resources (VPC, EC2, RDS) using Terraform to ensure reproducible, version-controlled infrastructure.
- **Automation & Deployment:** Built zero-downtime CI/CD pipelines with GitHub Actions, integrating automated testing and containerised deployments via Docker.
- **Outcome:** Delivered a secure, highly available platform that accelerated user onboarding and centralised cloud infrastructure management.

Scalable Web Application with React and Django

Dec 2024

- **Architecture & Hosting:** Built a full-stack IoT data management app using Docker for containerised consistency, AWS EC2 for backend hosting and Amazon RDS for the database.
- **Scalability & CI/CD:** Configured AWS Application Load Balancers and auto-scaling groups for performance during traffic spikes, driven by automated Jenkins pipelines.
- **Monitoring:** Enforced AWS CloudWatch and Sentry for real-time error tracking, enabling proactive performance optimisation.

Scalable Dash Application for IoT Monitoring

Sep 2024 – Oct 2024

- **Deployment:** Leveraged AWS Elastic Beanstalk to deploy a real-time data visualisation web app, reducing standard deployment time by 30%.
- **Automation & Scaling:** Established continuous integration with AWS CodePipeline and CodeDeploy, supported by auto-scaling configurations that achieved 40% performance gains at peak usage.

Secure Django Application Hosted in a VPS

Jul 2024

- **Deployment & Security:** Hosted a robust content management system on a dedicated VPS using PostgreSQL, with SSH key access, automated deployment scripts and strict firewall rules.
- **Performance:** Enforced Nginx as a reverse proxy to optimise traffic management, and set up Uptime Robot for continuous availability tracking.

REFERENCE ARCHITECTURES (SELF-DIRECTED)

Designed and built on my own time to work through problems I have not yet met in a role. These are not client deliverables. Each is documented decision by decision — including trade-offs and what I would change — at saikeshavareddych.github.io/projects.html

Multi-Cloud Landing Zone.

One Terraform module set provisioning governed AWS and Azure estates in parallel, with per-cloud network idioms and a shared control plane for remote state, policy checks, drift detection and cost guardrails.

AWS DevSecOps Pipeline.

Six delivery stages, each gated by a security check that fails closed: secret scanning, SAST, dependency and licence analysis, image scanning and signing, DAST, and a final policy gate. Federated credentials instead of static keys, with rollback driven by error budget.

Azure DevOps to AKS Delivery Platform.

Templated Azure Pipelines into blue-green deployments on AKS, with gated environments for an auditable approval trail and secrets mounted at pod start rather than held in pipeline variables.

Observability and SLO Platform.

A single collector for metrics, logs and traces across both clouds, joined in Grafana, with alerting driven by error-budget burn rate rather than static thresholds, and a rule that an alert without a runbook does not page.

Hackathon Platform (48 Hours).

Forty isolated team namespaces on one shared Kubernetes cluster with quotas and network policy, automatic DNS and wildcard TLS, a pull-through registry cache, and a scheduled teardown committed before the event opened.

EDUCATION

Bachelor of Technology in Electrical and Electronics Engineering

Jul 2020 – Aug 2023

Kamala Institute of Technology and Science

CGPA: 6.91

Diploma in Electrical and Electronics Engineering

Apr 2017 – Jun 2020

Jyothishmati Institute of Technology and Sciences

Percentage: 77.71%
